

# Let's get started!

We've found that it's helpful to have the motor and battery pack connected together in a single unit when building art machines. Here are some "base models" that are helpful to get people started; they show examples of different types of motion that can be explored before attaching the markers.

In the Tinkering Studio, we think of these starting points as suggestions and inspirations for learners to take the ideas further—remix, iterate and complexify them as new directions for experimentation emerge.
